

```
In [1]: import numpy as np
        from sklearn.svm import SVC
        from sklearn.feature_selection import RFE
        import matplotlib.pyplot as plt

In [2]: features = np.genfromtxt("./Aggregated_Data.csv", delimiter=",", usecols=(0, 1
        , 2, 3, 4, 5, 6, 7))
        target = np.genfromtxt("./Aggregated_Data.csv", delimiter=",", usecols=8)

#the supervised learning estimator
#I used the support vector classifier for simplicity
#I used the a linear kernel since our data is linearly separable (1 vs 0)
        estimator = SVC(kernel="linear")

#recursive feature elimination
#the estimator is a supervised learning estimator that helps the selector
#decide the importance of the features
#n_features_to_select is set to None, so it selects half the features to keep
#step is how many features to remove after each iteration (it removes the
#least important feature each time)
        selector = RFE(estimator = estimator, n_features_to_select = None, step=1)
        selector = selector.fit(features, target)
#support is an array of boolean values where True
#means the feature was selected
        print(selector.support_)
#the ranking of how important the feature is (1 being the highest)
        print(selector.ranking_)

[False  True False  True  True  True False False]
[4 1 3 1 1 1 2 5]
```

The important features are state, vaccination rate, UL, and CL.
